History of changes

"url"		
Changes		
Date	**Version**	**Comments**
2012-11-16	1.0	Transaktions-/Sessionstatus-Encoding (ISO-8859-1) documented.
2012-11-16	1.0	userid, accessid extended from 8 to 12 digits
2013-01-03	1.01	new document layout
2013-01-03	1.01	list of iDEAL banks updated
2013-02-27	1.02	Sessionstatus, errata "reverse_cancel" -> "cancel_reversal" New countries added to request bankaccountcheck Note to currency handling Note to IP V4 / IP V6 New payment types BillSAFE New parameters for TransactionStatus "vsettlement"
2013-04-15	1.03	New banks added to EPS bankgrouptype New banks added to iDEAL bankgrouptype Response to addresscheck: firstname and lastname may be returned New errorcode 938 Parameter "email" is mandatory for payment type BSV Table 5.4 added with possible combinations for BankAccountCheck.
2013-05-15	1.04	New errorcode 951
2013-09-11	1.05	Updated error text for error code 3200
2013-11-07	1.06	SEPA-specific extensions parameters "iban" / "bic" can be used – even without bankcode / bankaccount **Please note that API-responses may be extended by new response key/values at any time to provide additional features**
2013-11-14	1.07	note added for PMI configuration to enable additional response parameters Usage of IBAN / BIC: IBAN/BIC can be used together with bankcountry. If bankcountry is given it must match with IBAN. bankcountry is mandatory with bankcode, bankaccount PCS-merchants: mandate-identifications must be generated automatically
2013-11-19	1.08	New error code 2012 Response "bankaccountcheck": parameter "bankcountry" was missing
2013-12-04	1.09	Requests "ManageMandate" and "getfile" are only available with Server API Request "authorization" has been copied twice into API-documentation. Duplicate request has been removed.
2013-12-10	1.10	Comments to successurl, … changed: old: only if not provided in the PMI new: only if responsetype=REDIRECT or required by corresponding request additional response parameter added for direct debit requests Direct Debit Netherlands removed from chapter "1. General"

"url"		
Changes		
Date	**Version**	**Comments**
2014-03-05	1.11	Parameter "mandate_identification" was already included into hash calculation, but was missing in documentation, chapter 3.1.4
		Request "managemandate" has been added to Client-API -> new chapter 3.3 (Administration)
		Request "managemandate" is now available with BBAN (Germany only) and with userid/customerid if BBAN is attached to user
		Response data have been extended by "mandate_dateofsignature"
		Mode "live" / "test" consistently written in lower case.
		BankAccountCheck will return either "INVALID" or "ERROR" in case of invalid data.
		Error messages added and text corrected
2014-03-19	1.12	new error codes 878, 905, 909, 1007, 1367, 1372, 1373
		Parameter "telephonenumber" shortened from 50 to 30 characters
2014-09-05	1.13	new error codes 940, 941, 952, 1337, 1338, 1374, 1375
		Parameter for Klarna (KLV) added
		Parameter "shipping_addressaddition" has been removed as it is not used for any payment type
		Parameter "state" (regions) extended to these countries: US, CA, CN, JP, MX, BR, AR, ID, TH, IN
		Parameter "ecommercemode" was missing for request "authorization"
		Parameter "ecommercemode" was already used in hash-calculation, but this was missing in the documentation
		Documentation for TxStatus has been corrected: "cancellation" -> "cancelation"
		IMPORTANT NOTE: **Starting with 2014-12-29 the range of IP-addresses of the PAYONE Platform will be extended!** • **old: 213.178.72.196, 213.178.72.197, 217.70.200.0/24** • **new: 213.178.72.196, 213.178.72.197, 217.70.200.0/24, 185.60.20.0/24** **Please ensure that your systems will be able to accept outgoing and incoming connections to and from all these IP-addresses.**
2015-01-12	1.14	New error code 1012 added
		Parameter for Klarna installment (KLS) have been added
		Transaction Status PAYONE -> merchant: • new parameter "transaction_status" has been introduced (if your systems are not prepared to process new parameters, please contact our PAYONE Technical Support)
		Parameter "api_version" added -> see standard parameter
		only available with api_version >= 3.9: • New response "pending" added for "preauthorization" / "authorization"
		Request "createaccess" corrected: • "invoice_deliverydate" removed • "invoice_deliveryenddate" removed

"url"		
Changes		
Date	**Version**	**Comments**
		• it[n], id[n], pr[n], no[n], de[n], va[n], sd[n], ed[n], invoiceid removed • id_trail[n], no_trail[n], pr_trail[n], de_trail[n], va_trail[n], ti_trail[n] added • id_recurring[n], no_recurring[n], pr_recurring[n], de_recurring[n], va_recurring[n], ti_recurring[n] added
2015-02-25	1.15	Transaction Status PAYONE -> merchant: • description added for parameter "notify_version" (in use since January 2015) • txaction "failed": description corrected (mistake by copy&paste). -> this txaction is not in use yet. Parameter "api_version" added to hash calculation
2015-04-08	1.16	• PCS (PAYONE Collection Service) has been migrated to PPS (PAYONE Payment Service) • Chapter 1, "please note" chapter supplemented by reference to costs • Hash parameter "api_version" was listed at the end of hashed parameters (to indicate new value). Now it has been put into alphabetical order.
2015-06-03	1.17	• Additional support of hash algorithm "sha2-384" (HMAC-SHA-2, 384) PMI-setting to enforce usage of "sha2-384" (Hash-value of SessionStatus and TransactionStatus still remains with MD5 by now and is subject to change). • Transaction Status PAYONE -> merchant , txaction "failed" is used with "Barzahlen" and expired refund. • Character set for parameter "id" (product number) has been clearly defined • The hash values (key -> chapter, key -> 4.1, 4.2) are actually given as MD5. This actually still remains with MD5 and is subject to change in future to SHA2-384.
2015-06-17	1.18	• Description of "PAYONE hosted-iFrame mode" in chapter 3.1.5. -> PCI DSS V 3.0 SAQ A compliant implementation.
2015-06-29	1.19	• Chapter 3.1.5.3 calculation of hash corrected / explained.
2015-07-01	1.20	• Chapter 3.1.5.6, additional tips added • Chapter 3.1.5, known issue added with old version of framework "prototype"

2015-07-23	1.21	• Chapter 3.1.5, typo corrected
		    o old: new payone.ClientApi.Request(…)
		    o new: new Payone.ClientApi.Request(…)

2015-08-06	1.22	• Parameter "reference" for GPY must be min. 4, max. 20 characters

"url"
Changes

Date	Version	Comments

2015-12-07	1.23	• Online-Payment P24 added
		
		• Old IP-addresses for Session-Status and Transaction-Status removed.
		
		• CreateAccess: Added that "access_expiretime" and "period_unit_trail", "period_length_trail" can not be used. "access_expiretime" should not be used any more.
		
		• AddressCheck Person: added that firstname/lastname are mandatory
		
		• BankAccountCheck:
		old: Errorcode 888 (IBAN invalid) was returned with response "ERROR"
		new: Errorcode 888 (IBAN invalid) is returned with response "INVALID"
		
		• New error codes 972 and 973 have been added
		
		• Parameter "bankcode" and "clearing_bankcode" have changed from N..8 to AN..11
		
		• Parameter "bankaccount" and "clearing_bankaccount" have changed from AN..14 to AN..26
		
		• Added support IP V4/V6 for customers IP-address
		
		• ManageMandate:
		   o actually ManageMandate always reponds with "APPROVED" or "ERROR".
		   o in future (Q3 2016) ManageMandate will respond with "ERROR" for erroneous requests and may respond with "INVALID" for requests with invalid data
		-> responses "APPROVED", "ERROR" and "INVALID" may be used.

2016-01-28	1.24	• itemtype (Parameter „it") now does support „voucher" for PPE (PayPal Express) • Additional test data for "consumerscore" and "address check person". Please refer to separate document "PAYONE_Platform_Testdata_EN.pdf"
2016-02-15	**1.25**	• **New SSL-certificates for PAYONE -> https://www.payone.de/en/platform-integration/platform/important-technical-information/ssl-certificates/**
2016-02-23	1.26	• Naming changed from "truncated cardpan" to "masked cardpan". Parameter name "truncated cardpan" does remain unchanged. In fact "masked cardpan" means display of first six and last four digits while "truncated cardpan" means showing only last four digits. • Actually the pseudo card pan is 13 to 16 digits long. **In future the pseudo card pan will be 19 digits long.** This is already specified by format "N..19" and in future the full range of 19 digits will be used.
2016-03-18	1.27	• **Check of correct encoding will be enforced.** I.e.: If request-encoding is specified with "UTF-8" (Parameter "encoding") and non-matching characters are detected (e.g. "ß" instead of "U+00DF" or "Ö" instead of "U+00D6") the request will be rejected with errorcode=2013.

"url"		
Changes		
Date	**Version**	**Comments**
2016-05-09	1.28	• iDEAL: Bunq-Bank added (Parameter "bankgrouptype") • Contract/createaccess: Limit (3 years) for trail and recurring period documentated. • **Chapter 3.1.3: Special remarks to usage of not-used parameters.**

2016-07-26	1.29	• Additional features for "PAYONE hosted iFrame mode"
		   o Config-block for element "cardcvc2" has been extended by array "length" to specify the exact required CVC-length per cardtype
		   o response data have been extended by selected "cardtype" and used "cardexpiredate"
		   o Attribute "placeholder" can now be set for input fields.
		 • Responses for "customermessage" and "errormessage" can now have a maximum length of 1024 characters (previous length was limited to 255 characters). This is required due to special payment methods.
		 • American Express Safekey (3-D Secure) is planned for 2016-10-01
		 • China Union Pay / CUP (as credit card) is planned for 2016-10-01
		 • IBAN / BIC / bankcode / bankaccount can be omitted for SOFORTBanking (OBT/PNT) on API-level as they are returned from SOFORT and saved by PAYONE (for later upcoming SEPA-credits in case of refund).
		 • only available with api_version >= 3.10:
		 Response for "customermessage" can be more specific in case of error by containing detailed error messages from external payment gateways (e.g. Ratepay, …)

2016-07-27	1.30	• Example in chapter "Changing display text for error messages" corrected ("=" instead of ":")
2016-07-28	1.31	• Additional response data "cardtype" and "cardexpiredate" for creditcardcheck have been added at the JSON-sample, but were missing in the creditcardcheck-responstdata.

1 General

This technical reference includes detailed descriptions and examples for the communication with the PAYONE Platform.

PAYONE Platform supports the following methods of payment:

Direct debit:	Germany, Austria
	(ELV: electronic direct debit system)
Credit card:	Visa, MasterCard, American Express, JCB, Diners Club, Discover,…
Debit card:	Maestro International, Maestro UK, Carte Bleue
Online transfer:	Sofortbanking, giropay, eps (electronic payment standards), PostFinance E-Finance, PostFinance Card, iDEAL
Transfer:	Prepayment (worldwide), open invoice (worldwide), cash on delivery (worldwide)
e-wallets:	PayPal
Financing:	BillSAFE Invoice (deprecated), Klarna Invoice

PAYONE Platform includes the following optional modules:

Accounting:	Detection of incoming payments and overdue accounts that result from return debit notes, chargebacks and invoices which have not been settled by the specified date.
Contract:	Administration of subscriptions and recurring payments
Invoicing:	Generating invoices and credit memos
Collect:	Automatic recovery of overdue accounts via dunning processes and encashment
Protect:	Check of accuracy and evaluation of the submitted customer data
Reporting:	Specific export options for all transaction details
Billing:	Aggregated billing of individual purchases and subscriptions

The administration of subscriptions (Contract), the creation of invoices (Invoicing) and the dunning processes (Collect) are, depending on the settings, automatically carried out in the background. You can, however, use API to control these procedures.

The communication is based on HTTPS-POST requests (key/value pairs) between the merchant's systems and PAYONE Platform.

The PAYONE Platform and its connected systems are designed for IP addresses Version 4.

This technical reference may include functions that are not activated for your merchant account due to contractual terms. If you have any questions or problems please do not hesitate to contact our service team.

Please note:

Mode "test" / "live":

Basically all API-requests can be used in mode "test" and "live" in the same way. But please note that the processes may differ slightly different in mode "test" and "live". So in mode "test" a lot of downstreamed processes are simulated by the PAYONE Platform and are not forwarded to other service providers.

Please also note that you should not use any live data in mode "test". The PAYONE Platform offers a set of test data to simulate several test cases in payment processing. Please request the document "PAYONE Platform Test procedures and test data".

Attention: Requests in mode "live" are always processed and forwarded to service providers – even if test data are used. By this additional cost may come up (e.g. by post delivery of documents or by chargebacks).

Costs:

Please note that depending on the transaction type used costs may occur in addition to transaction fees. See our List of Prices and Services for details.

1.1 Accounts

The PAYONE Platform includes merchant accounts and what is known as sub accounts. For the settlement of your goods you need at least one sub account to which your payments will be allocated.

Each merchant account can include any number of sub accounts. This combination of merchant and sub accounts offers a multitude of flexible options to the merchant.

The merchant can, for example, allocate marketing campaigns to different sub accounts in order to receive exact statistics concerning all transactions, accesses, revenues, subscriptions and purchases generated through the corresponding marketing campaign. The merchant can thus easily measure and analyse the success of his marketing campaigns with just one merchant account.

This combination of merchant and sub accounts can also be used for multilevel marketing platforms (partner programs) or resellers.

1.2   Payment portals

In order to carry out payment processes via the PAYONE Platform, you must first create a payment portal. All settings regarding payment processes and debtor management are anchored in the payment portals. All payment processes are conducted via the different payment portals.

The PAYONE Platform has two different versions of payment portals: "Access" and "Shop".

The fundamental difference between the two payment portal versions is the following: In the "Access" version you need to set up orders/contract templates and the PAYONE Platform can handle the access management for you. You can define how long or how often your customers have access to your products and services after a successful payment process. In the same manner, subscriptions are supported by the PAYONE Platform payment portals of the version "Access".

"Access" payment portals are thus specifically useful for accounting digital products or services which will grant your customer access for a specific period of time determined by you or if the PAYONE Platform is to manage a subscription.

In payment portals of the version "Shop" a one-time settlement occurs. In this case it is not necessary to set up offers because the products and services that are to be settled are dynamically submitted to the PAYONE Platform. It is therefore possible to settle actual as well as digital products and services.

Versions:

"Access" version: Time-based settlement

(settlement of digital products and services for a specific period of time, such as memberships or subscriptions)

"Shop" version: Product /event-based settlement

(one-time settlement of actual or digital products and services)

1.3 Debtor accounts

With each initialisation of a payment process the PAYONE Platform sets up a debtor account and opens up a payment process in this account.

Each payment process includes a unique PAYONE payment process ID (txid). An individual balance is kept for each payment process. A payment process usually includes an invoice and, where applicable, several credit memos. All payments or return debit notes are automatically allocated to the corresponding payment process. Once a payment request is settled, the balance is reduced by the corresponding amount. In the case of return debit notes or chargebacks the balance is increased by the amount of the return debit notes.

During each booking the master data/payment data for the customer is saved. Each customer (debtor) is assigned a PAYONE debtor ID (userid) by the PAYONE Platform. If you enter the PAYONE debtor ID assigned by the PAYONE Platform (userid) for follow-up bookings for the same debtor, the booking will automatically be assigned to the same debtor.

The second option is to use your own customer ID (customerid). If you use the same customer ID (customerid) for two different bookings, the bookings will also be allocated to the same internal debtor by the PAYONE Platform.

Advantage:

All payment processes by the same debtor are managed automatically internally. Among other things, this makes it possible to synchronise the booking, dunning and encashment processes by combining several open requests for one debtor within one process. In addition, the payment processes or the master data/ payment data for one debtor can easily be administered.

By storing customer data in the PAYONE Platform it is moreover possible to initiate follow-up bookings for a customer without needing to submit the customer data. It is therefore not necessary for the merchant to store e.g. credit card information.

Attention:

When follow-up bookings for the same customer (debtor) (same userid or customerid) are carried out, the debtor's master data is updated / overwritten with the current values.

1.4 Invoicing

The PAYONE Platform can automatically generate invoices and credit memos for you and send these, e.g. as PDF documents, to your customer via email or post.

With the "Access" version the description provided in the offer you have generated is automatically used as the invoice item.

With the "Shop" version you have the possibility to supply the PAYONE Platform with your complete shopping cart including article number, quantity, description, price and VAT. These positions are automatically used as invoice items.

You can create the invoices according to your specifications.

Once the invoice is activated and the invoice/credit memo has been successfully carried out, an invoice/credit memo in your design is automatically created by the PAYONE Platform and sent to the customer as a PDF document via email or post. Afterwards you can download the invoices sent at any time in the PMI (PAYONE Merchant Interface).

For configuration of the PAYONE Platform invoicing module please contact the PAYONE merchant service.

1.5 Dunning processes and encashment

At your request the PAYONE Platform will carry out commercial dunning processes as well as the transfer to encashment. Within the dunning process, the customer will receive up to three reminders (e.g. via email, post) with requests for payment. If the dunning process is without success, the case can be transferred to an external encashment agency. All reminders that have been sent can be viewed via PMI (PAYONE Merchant Interface).

If an invoice is not settled by the specified date or in the case of return debit notes and chargebacks (credit card) the case is automatically transferred to the PAYONE Platform's internal dunning.

In the reminders, the customer receives an overview of all outstanding requests and of any additional fees that may have resulted. The email includes all data relevant for payment and the customer is therefore able to settle all outstanding requests by credit transfer straight away. The incoming payments are automatically assigned to the outstanding request by the PAYONE debtor management system. If the dunning procedure is without success, the case is transferred to an encashment agency.

The merchant is supplied with all outstanding requests via the TransactionStatus (see chapter 4.2). In the same manner the TransactionStatus transmits the settlement of every outstanding request. The customer is optionally provided with a confirmation mail acknowledging the settlement of the outstanding request.

For configuration of the PAYONE Platform Collect module please contact the PAYONE Merchant Service.

1.6 Administration of subscriptions

With the help of the Contract module the PAYONE Platform manages subscriptions and recurring payments. Terms, prices and dependencies can be defined freely within the PMI (PAYONE Merchant Interface), which means that complex order models can be displayed as well.

In order for subscriptions to be managed automatically via the PAYONE Platform, you must first provide the key details of the subscription in the PMI (PAYONE Merchant Interface). For this purpose, create a payment portal of the type "Access" and corresponding offers (templates) for the different subscriptions (see chapter 2.1). Here, you can define terms, prices, etc. for the subscription.

To initialise a subscription use the corresponding order ID (template) and a "createaccess" request. If the first booking is successful, a subscription will be created for the customer using the template.

All bookings created by the administration of subscriptions via the TransactionStatus (see chapter 4.2) are submitted to the merchant. If Invoicing is active, the customer will automatically receive an invoice with each booking.

For configuration of the PAYONE Platform Contract module please contact the PAYONE merchant service.

2   Payment portals

2.1   Payment portal version "Access"

2.1.1   Creating a payment portal of the version "Access"

In order to invoice your products and services with access management or administration of subscriptions via PAYONE, you must first create at least one payment portal of the version "Access".

Options

Portal name:	General description of the payment portal.
URL:	URL on which your products or services you wish to settle via this payment portal are to be found.
Sender email:	Email-address that is used for emails to end customers

2.1.2 Adding an offer to a payment portal

Options initial term

Name:	Will be used as article description for the creation of invoices.
Login time:	Defines the duration for the initial contract term. (Days/months/years) Do not exceed a duration of 36 months / 3 years.
Price:	Price for the initial contract term.

Options follow-up term / repeat term

Automatic renewal:	Activate this check box to activate repeat terms. If you activate this option, the subscription will be renewed until it is actively terminated.
Name:	Will be used as article description for the creation of invoices.
Repeat cycle:	Defines the duration of the repeat cycle. (Days/months/years). Do not exceed a duration of 36 months / 3 years.
Price:	Price of the repeat cycle
Currency:	The currency applies for both the initial term and the repeat term.
VAT tax rate:	The VAT tax rate applies for both the initial term and the repeat term.

2.1.3 Extended options of the payment portal

Options

SessionStatus URL:	Status changes for an open session (access) are transmitted to this URL via HTTP request. (see chapter 4.1) If you are using the SessionControl script, enter the corresponding URL here.
TransactionStatus URL:	Status changes for a payment process are transmitted to this URL via HTTP request. (see chapter 4.2)
Key:	This key is transmitted to the API/ SessionStatus/ TransactionStatus URL as an MD5 or SHA2-384 hash value with every call. **Attention:** The hash value has to be given in lower case.
Purpose:	Purpose used for this offer

2.2   Payment portal version "Shop"

2.2.1   Creating a payment portal of the version "Shop"

In order for the PAYONE System to be able to handle the payments for one or several products at a time, you must first create a payment portal of the version "Shop". Please notice the differences to the payment portal of the version "Access" (see 2.1).

Options

Shopname:	General description of the shop portal.
URL:	URL on which to find your products you wish to sell here.
TransactionStatus URL:	Status changes for a payment process are transmitted to this URL via HTTP request. (see chapter 4.2)
Key:	This key is transmitted to the API/ SessionStatus/ TransactionStatus URL as an MD5 or SHA2-384 hash value with every call.
	Attention: The hash value has to be given in lower case.

3 Interface definitions

3.1 General

3.1.1 Data transfer

The data transfer is processed directly via an HTTPS-POST or HTTPS-GET request by the browser of the customer.

The data is returned in JSON data format or as parameter in an HTTP redirect.

The requests must be sent to the following URL:

Client API URL: https://secure.pay1.de/client-api/

3.1.2 Standard parameter

With each request the following parameters must always be submitted.

Standard parameter			
Parameter	**Required**	**Format**	**Comment**
mid	+	N..6	Merchant account ID
portalid	+	N..7	Payment portal ID
api_version[1]	+	Default	3.8 Actual API-version (Default if not present) 3.9 New API-version from 2015-01-05 3.10 New API-version from 2016-06-01
mode	+	Default	test: Test mode live: Live mode
request	+	Default	Queries: - creditcardcheck - bankaccountcheck …
responsetype	+	Default	- JSON - REDIRECT
hash	+	AN..32 AN..96	MD5 hash code (see chapter 3.1.4) SHA2-384 hash code (see chapter 3.1.4)
successurl	o	AN..255	URL "payment successful" (only if responsetype=REDIRECT or required by corresponding request)
errorurl	o	AN..255	URL "faulty payment" (only if responsetype=REDIRECT or required by corresponding request)
encoding	-	Default	ISO 8859-1 (default) UTF-8

---

[1] New parameter "api_version" should be added to actual implementations as it will be mandatory in future.

3.1.3 Special remark

- All information described as "Unixtimestamp" refers to coordinated universal time (UTC) and is hence not subject to changing from daylight saving time to standard time.

- Only use key-value-pairs which are filled with meaningful data. All parameters that are not required for a request must not be used. Do not use dummy-values (like "-" or "x") and do not use empty values. E.g.:

  - request "updateuser" does not require a parameter "clearingtype" nor "currency".
    -> Do not send e.g. "clearingtype=" or "clearingtype=-", …

  - request "getinvoice" does not require a parameter "amount" nor "language".
    -> Do not send e.g. "amount=" or "amount=0", …

  - request "preauthorization" with "clearingtype=cc" (creditcard) does not require bankdata.
    -> Do not send e.g. "bankcountry=", "bankcountry=x", "iban=" or "iban=x", …

3.1.4 Calculation of the HASH value

The hash value protects the request parameters from changes by the customer, e.g. price changes.

The hash value is calculated from the request parameters and a secret key using the hash function hash("md5" , $data) or hash_hmac("sha2-384", $data, $key). Any parameter values to be protected are concatenated in alphabetical order. Finally the key will be attached to the string and the hash value is calculated.

Parameters are sorted by their name. It does not matter in which order they are used in the request URL. See below table for the parameters to be protected.

You can assign the key to be used in the PMI (PAYONE Merchant Interface). Do not pass this key to third parties in any case. You can also choose the desired hash algorithm in the PMI:

PMI, configuration, payment portals, hash calculation	
PMI-Selection	**Meaning**
md5 (actual method)	PAYONE platform expects hash value as md5 (md5 is compromised and should be replaced by sha2-384) for compatibility reason this is actually default.
sha2-384 (recommended method)	PAYONE platform expects hash value as sha2-384 (if you want to use sha2-384 hash values this option has to be activated)
md5_or_sha2-384 (during migration)	PAYONE platform accepts both hash calculations (md5 and sha2-384) (this option should only be use for migration from md5 to sha2-384)

The following parameter values must be included in the HASH value:

Parameter im HASH		
access_aboperiod	document_date	period_length_trail
access_aboprice	due_time	period_unit_recurring
access_canceltime	eci	period_unit_trail
access_expiretime	ecommercemode	portalid
access_period	encoding	pr[x]
access_price	errorurl	pr_recurring[x]
access_starttime	exiturl	pr_trail[x]
access_vat	getusertoken	productid
accesscode	id[x]	reference
accessname	id_recurring[x]	request

addresschecktype	id_trail[x]	responsetype
aid	invoice_deliverydate	settleaccount
amount	invoice_deliveryenddate	settleperiod
amount_recurring	invoice_deliverymode	settletime
amount_trail	invoiceappendix	storecarddata
api_version	invoiceid	successurl
backurl	it[x]	ti[x]
booking_date	mandate_identification	ti_recurring[x]
checktype	mid	ti_trail[x]
clearingtype	mode	userid
consumerscoretype	narrative_text	va[x]
currency	no[x]	va_recurring[x]
customerid	no_recurring[x]	va_trail[x]
de[x][2]	no_trail[x]	vaccountname
de_recurring[x]	param	vreference
de_trail[x]	period_length_recurring	

---

[2] [x] always means that all elements of the given array have to be part of the hash.

Attention:

PAYONE Platform expects the calculated hash value converted to lower case; e.g. 87dbc7c369b85b7a699adff1a2b27bab ("md5") or d0ff16426ec9071cfe12c4440738875f…caf28c5ac9abb52b5d ("sha2-384").

An example in PHP:

```
    $request="authorization";   // Request
    $portalid=2000001;          // Portal ID
    $mid=10001;                 // Merchant Account ID
    $aid=10002;                 // Sub Account ID
    $key="secret";              // Key (configurable in the payment portal)
    $responsetype="REDIRECT";   // Response type

    $id[1]="123-345"            // Your item no.
    $pr[1]=5900;                // Price in cent
    $no[1]=1;                   // Amount
    $de[1]="Puma Outdoor";      // Item description
    $va[1]=19;                  // Percentage of value added tax (option)
    $amount=round($pr[1]*$no[1]);// Total
    $currency="EUR";            // Currency
    $reference="73464354";      // Merchant Reference no.
    $customerid="123456";       // Merchant customer no. (option)

    // usage of md5-hash
    // select "md5" in PMI-portal-settings
    // $hash=md5($aid . $amount . $currency . $customerid . $de[1] .
    //       $id[1] . $mid . $no[1] . $portalid . $pr[1] . $reference .
    //       $request . $responsetype . $va[1] .
    //       $key);  // Parameters in sorted order + key

    // usage of sha2-384-hash
    // select "sha2-384" in PMI-portal-settings
    $hash=hash_hmac("sha384", $aid .
            $amount .
            $currency .
            $customerid .
            $de[1] .
            $id[1] .
            $mid .
            $no[1] .
            $portalid .
            $pr[1] .
            $reference .
            $request .
            $responsetype .
            $va[1], // Parameters in sorted order
            $key);  // $key is an individual parameter !
```

Attention:

The PAYONE Platform expects the hash value in small letters.

Please pay attention that for "sha2-384" the portal key is not part of parameters for hash-function, but a separate parameter passed to hash-function "hash_hmac".

3.1.5 PAYONE hosted-iFrame mode (credit card data, PCI DSS)

With the PAYONE hosted-iFrame mode you have the flexibility with design of integration and an easy PCI DSS certification with level SAQ A. The basic requirements to be eligible with SAQ A[3] are:

- Your company accepts only card-not-present (e-commerce or mail/telephone-order) transactions;
- All payment acceptance and processing are entirely outsourced to PCI DSS validated third-party service providers;
- Your company has no direct control of the manner in which cardholder data is captured, processed, transmitted, or stored;
- Your company does not electronically store, process, or transmit any cardholder data on your systems or premises, but relies entirely on a third party(s) to handle all these functions;
- Your company has confirmed that all third party(s) handling acceptance, storage, processing, and/or transmission of cardholder data are PCI DSS compliant; and
- Your company retains only paper reports or receipts with cardholder data, and these documents are not received electronically.

and

- The entirety of all payment pages delivered to the consumer's browser originates directly from a third-party PCI DSS validated service provider(s).

With PAYONE hosted-iFrame mode you will be compliant with all these requirements as the input fields for sensitive credit card data are designed as iframes and are provided by the PCI DSS certified PAYONE platform.

Include the following JavaScript in your HTML page containing the form:

JavaScript URL: https://secure.pay1.de/client-api/js/v1/payone_hosted_min.js

Remark

This JavaScript includes support of classic Client-API features described in chapter "AJAX mode" and "Redirect mode" (see following chapters) to support bank based payments and the PAYONE hosted iFrame mode.

To use the features of the classic Client-API with the new JavaScript you simply have to change "new PayoneRequest(…)" to "new Payone.ClientApi.Request(…)".

Known issues

There is a known issue with an old version (1.6 or before) of framework "prototype" – please ensure to use the actual version (at least 1.7).

---

[3] Please refer to PCI DSS Security Standards listed in SAQ A V3 on https://de.pcisecuritystandards.org

3.1.5.1 Brief description

The merchant has to implement:

- A selector for cardtype (see example: <select id="cardtype">)
  Configure your credit card acceptance here with the desired credit card types.
  The selected cardtype has to be passed to the public method "setCardType".
  You may also specify in config.cardtype available cardtypes for selection in a PAYONE iFrame.

- Place a label for each credit card input field and a div-container for the input iframes (see example: <div id="cardpanInput"></div>)

- Optional: place a div-container to display error messages returned from the creditcardcheck (see example: <div id="error"></div>)

- Define an object to configure the design of the iFrames (see example: config =)
  - Optional: Attribute "cardtype" can be configured with allowed cardtypes that are displayed in a PAYONE iFrame.
    -> Then the cardtype selector in your shop has to be removed.
  - The attributes "cardpan", "cardcvc2", "cardexpiremonth", "cardexpireyear" are fixed.
  - The value for attribute "selector" refers to the name of your div-container where the PAYONE iFrame should be rendered.
  - You may specify for each field the type of input (text, password, tel [4] and select (month/year only) using the attribute "type" and a CSS-style using the attribute "style".
  - The value for attribute "error" refers to the name of your div-container where error-messages should be displayed.
  - Pass your currently selected language to the config-object

Once all fields are set you will have to start the public function "iframes.creditCardCheck" which will initiate a creditcardcheck-request. This request will check the entered creditcard details and return a response-object which contains either:

- response.status = "VALID"
- response.pseudocardpan containing the unique pseudocardnumber (Pseudo-PAN)
- response.truncatedcardpan containing the masked creditcard number (masked PAN)
- response.cardtype containing the selected cardtype
- response. cardexpiredate containing the entered expiredate (YYMM)

or

- response.status = "INVALID"

---

[4] type "tel" can be used to display a simple, numeric phone keyboard on mobile devices.

- response.errorcode -> please refer to the section "error messages"
- response.errormessage in the specified language

3.1.5.2 Table of config-attributes

These attributes and values are allowed in object "config.fields":

cardtype	cardpan	cardcvc2	cardexpiremonth	cardexpireyear	attribute	value
x					cardtypes	define possible cardtypes for selection in PAYONE iFrame, e.g. ["V", "M", "A"]
x	x	x	x	x	selector	name of your div-container, e.g. "cardpan"
	x	x	x	x	size	size of input field in characters, e.g. "20"
	x	x	x	x	maxlength	maximum length of accepted input, e.g. "20"
	x				length	Array of exact length of accepted input per CC-type e.g.: length: { "A": 4, "V": 3, "M": 3, "J": 0 }
	x	x	x	x	type	define type of input field: "text"　　　input is visible "tel"　　　input is visible, simple keyboard is displayed on mobile devices "password"　input is masked "select"　　display selection/drop-down with possible values (only valid for month and year)
x	x	x	x	x	style	CSS style properties, e.g. "font-size: 1em; border: 1px solid #000; background: white; color: red; width: 145px; height: 70px; font-family: 'Courier'; font-style: italic; font-weight: bold; text-align: center; letter-spacing: 2px;" *Remark:* • *You may use any CSS style property except "url".* • *If "url" is used the style will be ignored as PCI DSS does not allow external ressources.* • *These characters must not be used: "\", "/", "?", "<" and ">"*
x	x	x	x	x	iframe.height	size

x	x	x	x	x	iframe.width	size, e.g.:
						iframe: {
						　height: "25px",
						　width: "250px"
						}

These attributes and values are allowed in object "config.defaultStyle":

attribute	value
input	CSS style properties for input fields, e.g. "font-size: 1em; border: 1px solid #000; width: 175px;"
select	CSS style properties for select fields, e.g. "font-size: 1em; border: 1px solid #000;"
iframe.height	size in pixel

iframe.width	size in pixel, e.g.:
	iframe: {
	   height: "25px",
	   width: "250px"
	}

3.1.5.3 Table of request-attributes

These attributes and values are allowed in object "request":

attribute	value
request	fixed value: 'creditcardcheck'
responsetype	fixed value: 'JSON'
storecarddata	fixed value: 'yes'
mode	mode for transactions, either 'live' or 'test'
encoding	your encoding, either 'ISO-8859-1' or 'UTF-8'
mid	your Merchant ID
aid	your Account ID
portalid	your Portal ID
hash	MD5 or sha2_384 hash over request values (alphabetical order) plus portal key in your PMI portal configuration. e.g.: - aid: '10002', // your AID - encoding: 'UTF-8', // desired encoding - mid: '10001', // your MID - mode: 'live', // desired mode - portalid: '2000002', // your PortalId - request: 'creditcardcheck', // fixed value - responsetype: 'JSON', // fixed value - storecarddata: 'yes', // fixed value - PMI Portal key: '123456' MD5('10002UTF-810001live2000002creditcardcheckJSONyes123456') =5c4014cebeb361d9e186fd42c810b9b1 or hash_hmac("sha384", "10002UTF-810001live2000002creditcardcheckJSONyes", "123456") =1cf456bf692453613ebb992a3fb859cc347ddc7e94e2ca764efbe8b0089de6964ab1266df0831e59de89dc5291070fe7

3.1.5.4 Simple example (cardtype selected in PAYONE iFrame)

This example will show how to configure PAYONE hosted-iFrame mode with cardtype selection in a PAYONE iFrame.

Simply change:

- config.fields.cardtypes to your cardtypes you'd like to process
- config.fields.*.style to your CSS layout
- request.*-fields to your mid, aid, portalid, mode, encoding and hash value

and finally

- initiate a preauthorization / authorization via received "pseudocardpan".

```html
<html>
<head lang="en">
    <meta charset="UTF-8">
    <title>Simple example for PAYONE hosted-iFrame mode</title>

    <style type="text/css" media="screen, projection">
        * {
            margin: 0;
            padding: 0;
        }
        body {
            background: #FFF;
            color: #000;
            font: 0.9em "Helvetica";
        }
        fieldset {
            padding: 1em;
            border: 1px solid #000;
            width: 275px;
            margin: 10px;
        }
        label {
            margin-right: 10px;
            float: left;
            width: 80px;
            padding-top: 0.3em;
            text-align: right;
        }
        input, select{
            font-size: 1em;
            border: 1px solid #000;
            padding: 0.1em;
        }
        select {
            margin-right: 10px;
        }

        input, .inputIframe, select {
            display: block;
            margin-bottom: 10px;
        }

        input {
            width: 175px;
        }

        #paymentsubmit {
            float: right;
            width: auto;
            padding: 5px;
            margin-bottom: 0px;
            margin-right: 10px;
        }
        #errorOutput {

            text-align: center;
            color: #ff0000;
            display: block;
        }
    </style>
```

```
</head>

        storecarddata: 'yes',                        // fixed value
        // hash calculated over your request-parameter-values (alphabetical request-order) plus PMI portal
key
        // hash:
'1cf456bf692453613ebb992a3fb859cc347ddc7e94e2ca764efbe8b0089de6964ab1266df0831e59de89dc5291070fe7'
        hash: '5c4014cebeb361d9e186fd42c810b9b1'     // see Chapter 3.1.5.3
    };
    var iframes = new Payone.ClientApi.HostedIFrames(config, request);

    function check() {                               // Function called by submitting PAY-button
        if (iframes.isComplete()) {
            iframes.creditCardCheck('checkCallback');// Perform "CreditCardCheck" to create and get a
                                                     // PseudoCardPan; then call your function
"checkCallback"
        } else {
            console.debug("not complete");
        }
    }

    function checkCallback(response) {
        console.debug(response);
        if (response.status === "VALID") {
            document.getElementById("pseudocardpan").value = response.pseudocardpan;
            document.getElementById("truncatedcardpan").value = response.truncatedcardpan;
            document.paymentform.submit();
        }
    }

</script>
</body>
</html>
```

3.1.5.5 Simple example (cardtype set by shop-system)

This example will show how to configure PAYONE hosted-iFrame mode with cardtype selection in your shop / website

Simply change:

- config.fields.*.style to your CSS layout
- request.*-fields to your mid, aid, portalid, mode, encoding and hash value

and set

- your selected credit card type via public method "setCardType"

and finally

- initiate a preauthorization / authorization via received "pseudocardpan".

```html
<html>
<head lang="en">
    <meta charset="UTF-8">
    <title>Simple example for PAYONE hosted-iFrame mode</title>
    <style type="text/css" media="screen, projection">
        * {
            margin: 0;
            padding: 0;
        }
        body {
            background: #FFF;
            color: #000;
            font: 0.9em "Helvetica";
        }
        fieldset {
            padding: 1em;
            border: 1px solid #000;
            width: 275px;
            margin: 10px;
        }
        label {
            margin-right: 10px;
            float: left;
            width: 80px;
            padding-top: 0.3em;
            text-align: right;
        }
        input, select{
            font-size: 1em;
            border: 1px solid #000;
            padding: 0.1em;
        }
        select {
            margin-right: 10px;
        }

        input, .inputIframe, select {

            iframes.creditCardCheck('checkCallback');// Perform "CreditCardCheck" to create and get a
                                                    // PseudoCardPan; then call your function
"checkCallback"
        } else {
            console.debug("not complete");
        }
    }

    function checkCallback(response) {
        console.debug(response);
        if (response.status === "VALID") {
            document.getElementById("pseudocardpan").value = response.pseudocardpan;
            document.getElementById("truncatedcardpan").value = response.truncatedcardpan;
            document.paymentform.submit();
        }
    }

</script>
</body>
</html>
```

3.1.5.6 Additional tips

3.1.5.6.1 Changing display text for month drop down

To change the display text in month selection drop down just add this code block just before initiating the iFrames via "new Payone.ClientApi.HostedIFrames (config, request)" in your shop:

```
Payone.ClientApi.Language.de.months.month1 = "Januar";
Payone.ClientApi.Language.de.months.month2 = "Februar";
Payone.ClientApi.Language.de.months.month3 = "März";
…
Payone.ClientApi.Language.en.months.month1 = "January";
Payone.ClientApi.Language.en.months.month2 = "February";
Payone.ClientApi.Language.en.months.month3 = "March";
…
```

Please pay attention to replace "en" by your desired language. Further languages can be added.

3.1.5.6.2 Changing display text for error messages

To change the display text for error messages add this code block just before initiating the iFrames via "new Payone.ClientApi.HostedIFrames (config, request)" in your shop:

```
Payone.ClientApi.Language.en.invalidCardpan = "your error text";
Payone.ClientApi.Language.en.invalidCvc = "your error text";
Payone.ClientApi.Language.en.invalidPanForCardtype = "your error text";
Payone.ClientApi.Language.en.invalidCardtype = "your error text";
Payone.ClientApi.Language.en.invalidExpireDate = "your error text";
Payone.ClientApi.Language.en.invalidIssueNumber = "your error text";
Payone.ClientApi.Language.en.transactionRejected = "your error text";
…
other languages if desired
```

Please pay attention to replace "en" by your desired language. Further languages can be added.

3.1.5.6.3 Specifying placeholder text for input fields

A placeholder text can be specified per input field (type "text", "password" and "tel"). Therefore add this block just before initiating the iFrames via "new Payone.ClientApi.HostedIFrames (config, request)" in your shop:

```
Payone.ClientApi.Language.de.placeholders.cardpan = 'Kartennummer';
Payone.ClientApi.Language.de.placeholders.cvc = 'CVC';
…
Payone.ClientApi.Language.en.placeholders.cardpan = 'Cardnumber';
Payone.ClientApi.Language.en.placeholders.cvc = 'CVC';
…
```

Please pay attention to replace "en" by your desired language. Further languages can be added.

3.1.6 AJAX mode

In AJAX mode, values entered in a form can be checked and processed directly without reloading the web page. In order to enable this, two JavaScripts are required: one JavaScript inside the form and one JavaScript hosted by PAYONE. The second JavaScript is required because JavaScript does not allow cross-domain access. Checking and processing the data via AJAX should take place before the form is sent to the shop.

Include the following JavaScript in your HTML page containing the form:

AJAX JavaScript URL: https://secure.pay1.de/client-api/js/ajax.js

Remark

Payment data should not come into touch with your system. This is very important with credit card data. Certification according to the PCI standard is not necessary only if the card data does not come into touch with your systems. Sensible payment data should be removed from the form after checking and processing via the client API (see below) in order to not have contact with your systems. Any other data can be queried in preceding steps.

Important note

This mode is also known as "direct post". The input fields are placed on the merchant payment page and not provided by PAYONE. Therefore the merchant needs to comply with PCI DSS SAQ A-EP certification. To be SAQ A compliant PAYONE recommends implementation of the PAYONE hosted-iFrame-solution.

JavaScript/AJAX code example

```javascript
var data = {
      request : 'creditcardcheck',
      responsetype : 'REDIRECT',               // JSON or REDIRECT available
      mode : 'live',
      mid : '10000',
      aid : '10001',
      portalid : '2000000',
      encoding : 'UTF-8',
      storecarddata : 'yes',
      hash : '19062005567ca72601cc9d031f9a94b1',
      cardholder : document.Testform.cardholder.value,
      cardpan : document.Testform.cardpan.value,
      cardtype : document.Testform.cardtype.value,
      cardexpiremonth : document.Testform.cardexpiremonth.value,
      cardexpireyear : document.Testform.cardexpireyear.value,
      cardcvc2 : document.Testform.cardcvc2.value,
      language : 'en'
}

var options = {
      return_type : 'object',
      callback_function_name : 'processPayoneResponse'
}

function processPayoneResponse(response) {
      if (response.get('status') == 'VALID') {
            document.Testform.cardpan.value='';
            document.Testform.cardcvc2.value='';

      document.Testform.pseudocardpan.value=response.get('pseudocardpan')
            document.Testform.submit();
      }
      else {
            alert(response.get('customermessage'));
      }
}

var request = new PayoneRequest(data, options);
request.checkAndStore();
```

JSON response example

```json
{
   "status" : "ERROR",
   "errorcode" : "1078",
   "errormessage" : "Parameter {cardpan} incorrect or missing",
   "customermessage" : "Invalid cardpan. Please check the information on the card.",
}
```

3.1.7 Redirect mode

Form inputs are sent directly to the client API when working in redirect mode. The client API processes the request and forwards the user to a specific page of the online shop, depending on the result. The client API itself does not produce any output.

Redirect URLs

Success URL	The customer is forwarded to this URL if the query was successful. (e.g. if the payment was successful or if the address check was positive)
Error URL	The customer is forwarded to this URL if the query was not successful. (e.g. if the payment was denied or if the address check was negative)

Response data are attached to the URL as GET parameters and can be processed by you.

The end customer is directly forwarded to the "redirecturl" if provided in the PAYONE Platform response. After that, the end customer is send back to your success URL or error URL.

Remark

Payment data should not come into touch with your system. This is very important with credit card data. Certification according to the PCI standard is not necessary only if the card data does not come into touch with your systems. Sensible payment data should be sent directly from the form to the client API and should not be forwarded trough your systems (see below). Any other data can be queried in preceding steps.

Important note

This mode is also known as "direct post". The input fields are placed on the merchant payment page and not provided by PAYONE. Therefore the merchant needs to comply with PCI DSS SAQ A-EP certification. To be SAQ A compliant PAYONE recommends implementation of the PAYONE hosted-iFrame-solution.

HTML example

```
<form action="https://secure.pay1.de/client-api/" method="POST">
<input type="hidden" name="portalid" value="2000000">
<input type="hidden" name="aid" value="10000">
<input type="hidden" name="mode" value="test">
<input type="hidden" name="request" value="bankaccountcheck">
<input type="hidden"
  name="successurl" value="http://www.yoursite.com/success.php">
<input type="hidden"
  name="errorurl" value="http://www.yoursite.com/error.php">
<input type="hidden" name="hash" value="70eaec2a33fa1b4674c0b1ge5e982966">
<input type="hidden" name="responsetype" value="REDIRECT">
<input type="hidden" name="language" value="en">
<input type="hidden" name="bankcountry" value="EN">
<table>
<tr>
  <td>Account number</td>
  <td><input type="text" name="bankaccount"></td>
</tr>
<tr>
  <td>Sort code</td>
  <td><input type="text" name="bankcode"></td>
</tr>
</table>
<input type="submit" value="Buy now!">
</form>
```

Redirect example

```
http://www.yoursite.com/error.php?status=ERROR&errocode=1083&errormessage=
Parameter+%7Bbankaccount%7D+incorrect+or+missing&customermessage=
Invalid+account+number.+Please+check+the+information+on+the+card.
```

3.2 Payment
3.2.1 Initiating payment reservation (preauthorization)

With the "preauthorization" request the transmitted amount is reserved. According to the type of payment, specific functions are carried out.

This option is only available in the "Shop" option.

Credit card	Credit card data is verified and stored.
	The amount is reserved on the customer's card
Debit payment	Account data is verified and stored.
Online Bank Transfer	Account data is verified
	Online transfer session is initialised
	Amount will be charged to the account directly after payment is completed
e-wallet	E-wallet session is initialised
	Amount is reserved after the payment has been completed
Prepayment	Data is stored
	Payment process is initialised
Invoice	Data is stored
	Payment process is initialised
Cash on delivery	Data is stored
	Payment process is initialised
Financing	Payment type BillSAFE requires item data, billing and delivery address need to be identical.

PAYONE Business

No receivable is entered upon this request.

Request "preauthorization"

Parameter	Required	Format	Comment
aid	+	N..6	Sub account ID
clearingtype	+	Default	elv Debit payment cc Credit card rec Invoice cod Cash on delivery sb Online Bank Transfer wlt e-wallet fnc Financing
reference	+	AN..20	Merchant reference number for the payment process. (Permitted symbols: 0-9, a-z, A-Z, .,-,_,/) special limits / restrictions: GPY min./max: AN 4..16
amount	+	N..7	Total amount (in smallest currency unit! e.g. cent)
currency	+	Default	Currency (ISO 4217)
param	-	AN..255	Individual parameter
narrative_text	-	AN..81	Dynamic text element on account statements (3 lines with 27 characters each) and credit card statements.
Parameter (personal data)			
customerid	-	AN..20	Merchant's customer ID (Permitted symbols: 0-9, a-z, A-Z, .,-,_,/)
userid	-	N..12	Debtor ID (PAYONE)
salutation	-	AN..10	Title (e.g. "Mr.", "Mrs.", "company")
title	-	AN..20	Title (e.g. "Dr", "Prof.")
firstname	o	AN..50	First name (optional if company is used) Mandatory for payment type KLV, KLS

addressaddition	-	AN..50	Address line 2 (e.g. "7th floor", "c/o Maier") Mandatory for payment type KLV, KLS NL
zip	-	AN..10	Postcode Mandatory for payment type KLV, KLS
city	-	AN..50	City Mandatory for payment type KLV, KLS
country	+	Default	Country (ISO 3166)
state	-	Default	State (ISO 3166-2 subdivisions)

Request "preauthorization"			
Parameter	**Required**	**Format**	**Comment**
			(only if country=US, CA, CN, JP, MX, BR, AR, ID, TH, IN)
email	-	AN..50	Email address
			Mandatory for payment type BSV, KLV, KLS
telephonenumber	-	AN..30	Telephone number
birthday	-	N8	Date of birth (YYYYMMDD)
			Mandatory for payment type KLV, , KLS
language	-	Default	Language indicator (ISO 639)
			Mandatory for payment type KLV, KLS
			KLV, KLS support sv, nb (norwegian), fi, da, de, nl
vatid	-	AN..50	VAT identification number
gender	-	Default	f=female, m=male
			Mandatory for payment type KLV, KLS DE, NL, AT
personalid	-	AN..32	Person specific numbers or characters
			Mandatory for payment type KLV, KLS SE, FI, DK, NO Format: A-Z, a-z, 0-9, +-./()
ip	-	AN..39	Customer's IP-V4-address (123.123.123.123) or IP-V6-address
			Mandatory for payment type KLV, KLS
Parameter (delivery data)			
shipping_firstname	-	AN..50	First name
shipping_lastname	-	AN..50	Surname
shipping_company	-	AN..50	Company
shipping_street	-	AN..50	Street number and name
shipping_zip	-	AN..10	Postcode
shipping_city	-	AN..50	City
shipping_state	-	Default	State (ISO 3166-2 subdivisions)
			(only if country=US, CA, CN, JP, MX, BR, AR, ID, TH, IN)
			Mandatory for PPE if shipping_country listed above
shipping_country	-	Default	Country (ISO 3166)
Parameter (debit payment)			
bankcountry	+	Default	Account type/ country
			for use with BBAN: DE, AT
			for use with IBAN only (from 2014-02-01): DE
			for use with IBAN/BIC: SEPA-countries
bankaccount	o	AN..26	Account number (BBAN)
			DE only: IBAN/BIC can be calculated by PAYONE platform automatically given by bankcode/bankaccount
bankcode	o	AN..11	Sort code (BBAN) (only in DE)

Request "preauthorization"			
Parameter	**Required**	**Format**	**Comment**
			DE only: IBAN/BIC can be calculated by PAYONE platform automatically given by bankcode/bankaccount (BBAN)
iban	o	AN..35	International Bank Account Number Only capital letters, no spaces If both (BBAN and IBAN) are submitted, IBAN is splitted into BBAN and processed.
bic	o	AN..11	Bank Identifier Code Only capital letters, no spaces
bankaccountholder	o	AN..35	Account holder
mandate_identification	o	AN..35	Can be used to enforce a merchant specific mandate identification. The mandate_identification must be unique. Allowed characters: A-Z a-z 0-9 + - . ( ) If the mandate_identification is not set PAYONE will create a unique mandate identification (pattern: PO-nnnnnnnnnn). PPS: This parameter must not be used!
Parameter (online transfer)			
onlinebanktransfertype	+	Default	PNT Sofortbanking (DE, AT, CH, NL) GPY giropay (DE) EPS eps – online transfer (AT) PFF PostFinance E-Finance (CH) PFC PostFinance Card (CH) IDL iDEAL (NL) P24 Przelewy24 (P24)
bankcountry	+	Default	Account type/ country (DE, AT, CH, NL)
bankaccount[5]	o	AN..26	Account number (giropay & Sofortbanking only) DE only: IBAN/BIC can be calculated by PAYONE
bankcode[5]	o	AN..11	Sort code (giropay & Sofortbanking only) DE only: IBAN/BIC can be calculated by PAYONE
bankgrouptype	o	Default	Bank Group (see chapter 5) (eps & iDEAL only)
iban[5]	o	AN..35	International Bank Account Number Only capital letters, no spaces

---

[5] Can be omitted for OBT/PNT (Sofortbanking) from 2016-10-01 on as bank data are received from SOFORT and stored for later credits (processed as SEPA-credit).

Request "preauthorization"			
Parameter	**Required**	**Format**	**Comment**
			If both (BBAN and IBAN) are submitted, IBAN is splitted into BBAN and processed.
bic[5]	o	AN..11	Bank Identifier Code Only capital letters, no spaces
successurl	o	AN..255	URL "payment successful" (only if responsetype=REDIRECT or required by corresponding request)
errorurl	o	AN..255	URL "faulty payment" (only if responsetype=REDIRECT or required by corresponding request)
backurl	o	AN..255	URL "Back" or "Cancel" (only if responsetype=REDIRECT or required by corresponding request)

Request "preauthorization"			
Parameter	Required	Format	Comment
Parameter (e-wallet)			
wallettype	+	Default	Wallet provider PPE: PayPal Express
successurl	o	AN..255	URL "payment successful" (only if responsetype=REDIRECT or required by corresponding request)

[8] AVS (Address Verification System) is currently only supported for American Express

[9] **Parameter "mandate_identification" will not be provided actually to prevent declined requests by merchant systems that do not expect these key/values by now. Parameter has to be enabled in PMI, Configuration, Payment portals, General: "Additional response-data" for mode test and live.**

3.2.2 Initiating payment process (authorization)

With the "authorization" request the payment process is initiated. According to the type of payment, specific functions are carried out.

This request is <u>only</u> available in the "Shop" version.

Credit card	Card data is verified
	Card is charged immediately
Debit payment	Account data is verified
	Debit payment is carried out
Online transfer	Account data is verified where applicable
	Online transfer session is initialised
	Amount will be charged to the account directly after payment is completed
e-wallet	E-wallet session is initialised
	Amount will be charged to the account directly after payment is completed
Prepayment	<u>Not</u> supported by this request!
Invoice	Payment process is initialised

PAYONE Business

The request is booked to the transaction account immediately after the successful payment. The time of payment therefore depends on the type of payment. The only exception is the invoice - in this case the request is booked immediately independent of the payment.

The TransactionStatus informs you about the status of the requests. The TransactionStatus communicates, among other things, incoming payments when using the payment type invoice/prepayment and return debit notes or chargebacks if applicable (see chapter 4.2).

Module invoicing

For invoicing via PAYONE Platform you must submit all items that shall appear on the invoice. To do so, submit the parameters id[n], pr[n], no[n], de[n], va[n]. Start with item n=1. For all following articles use n=2, n=3, and so on. Accordingly, id[2],pr[2],no[2],de[2],va[2] are the parameters for item 2, and so on.

Attention: If a parameter is missing, the whole item will not be considered!

[14] **Parameters will not be provided actually to prevent declined requests by merchant systems that do not expect these key/values by now. Parameters have to be enabled in PMI, Configuration, Payment portals, General: "Additional response-data" for mode test and live. Settings will be available by end of November.**

3.2.3 Creating a contract (createaccess)

For processing a purchase transaction in connection with session management or with initiating a subscription

This request is only available with the version "Access".

Important notes:

- For the time-based settlement of goods or subscriptions you must first create offers in your merchant area.
- You have the option to submit values that overwrite the settings for the offer used (e.g. price, term, etc.). These optional submitted values will be used for all following periods of this contract. The original offer is not changed.
- If the time at which access is first granted is in the future or the initial term is free of charge, a reservation, which will later be cancelled automatically, is carried out. The amount for the reservation is one payment unit (e.g. 1 EUR). This procedure is simply used to verify the customer's payment data and to check the customer data using risk checks, provided that these are active. The first "real" booking will be effected at the start of the first period that requires a charge.
- The periods (defined by "period_unit_trail", "period_length_trail", "period_unit_recurring", "period_length_ recurring") are limited to 36 months / 1095 days maximum.

Request "createaccess"			
Parameter	**Required**	**Format**	**Comment**
aid	+	N..6	Sub account ID
clearingtype	+	Default	elv Debit payment cc Credit card rec Invoice

customermessage	-	AN..1024	Error message for the end customer (Language selection is based on the end customer's language, „language")

3.3   Administration

3.3.1   Create a mandate (managemandate)

Create a pending mandate – used for SEPA Direct Debit. Mandate will be activated and persisted by a payment-request (preauthorization / authorization) or by customer management (updateuser) – this request has to follow a "managemandate"-request within 2 hours.

Request "managemandate"			
Parameter	**Required**	**Format**	**Comment**
aid	+	N..6	Sub account ID
clearingtype	+	Default	elv Debit payment
mandate_identification	-	AN..35	Can be used to enforce a merchant specific mandate identification. The mandate_identification must be unique. Allowed characters: A-Z a-z 0-9 + - . ( ) If the mandate_identification is not set PAYONE will create an unique mandate identification (pattern: PO-nnnnnnnnnn). PPS: This parameter must not be used!
currency	+	Default	Currency (ISO 4217)
Parameter (personal data)			
customerid	o	AN..20	Merchant's customer ID (Permitted symbols: 0-9, a-z, A-Z, .,-,_,/) either • existing customerid • or existing userid • or lastname/city/bankcountry/IBAN/BIC must be given
userid	o	N..12	Debtor ID (PAYONE)
lastname	+	AN..50	Surname
firstname	-	AN..50	First name (optional if company is used)
company	-	AN2..50	Company
street	-	AN..50	Street number and name
zip	-	AN..10	Postcode
city	o	AN..50	City only optional if already recorded at existing customer referenced by userid/customerid
country	+	Default	Country (ISO 3166)
email	o	AN..50	Email address
language	-	Default	Language indicator (ISO 639), default="de"
Parameter (bank account data – Germany only) optional if already recorded at existing customer referenced by userid/customerid			
bankcountry	o	Default	Account type/ country for use with BBAN mandatory: DE only, bankcode, bankaccount; IBAN/BIC will be calculated

Request "managemandate"			
Parameter	Required	Format	Comment
			optional with iban/bic
bankaccount	o	AN..10	Account number (BBAN) (only for DE)
			DE only: IBAN/BIC can be calculated by PAYONE platform automatically given by bankcode/ bankaccount
bankcode	o	AN..11	Sort code (BBAN) (only for DE)
			DE only: IBAN/BIC can be calculated by PAYONE platform automatically given by bankcode/ bankaccount (BBAN)
Parameter (bank account data – Germany plus all other countries) optional if already recorded at existing customer referenced by userid/customerid			
bankcountry	o	Default	Account type/ country (ISO 3166)
iban	o	AN..35	International Bank Account Number
			Only capital letters, no spaces
			only optional if already recorded at existing customer referenced by userid/customerid
bic	o	AN..11	Bank Identifier Code
			Only capital letters, no spaces

Response "managemandate"			
Parameter	Required	Format	Comment
status	+	Default	APPROVED / ERROR
Parameter (APPROVED)			
mandate_identification	+	AN..35	Mandate identification (either taken from request or newly created)
mandate_status	+	Default	pending: for a new created mandates
			active: for existing / active mandates
mandate_text	+	TEXT	Content of mandate text
			HTML-formatted, URL-encoded
creditor_identifier	+	AN..35	Creditor identifier as recorded at PAYONE
iban	+	AN..35	IBAN
bic	o	AN..11	BIC, if given in request
Parameter (ERROR) -> actual response; will be always used for errournous requests **Parameter (INVALID)** -> may be used in future Q3/2016 for invalid data in request			
errorcode	+	N..6	Error number
errormessage	+	AN..1024	Error message for the merchant
customermessage	-	AN..1024	Error message for the end customer
			(Language selection is based on the end customer's language, „language")

3.4   Verification / Scoring
3.4.1   Verifying credit cards (creditcardcheck)

The CreditCardCheck checks credit cards for plausibility in real-time.

Additionally, this request offers the possibility to store credit card data. In this case, the response submits what is known as a pseudo card number.

Request "creditcardcheck"			
Parameter	Required	Format	Comment
aid	+	N..6	Sub account ID
cardpan	+	N..19	Card number
cardtype	+	Default	Card type V Visa M MasterCard A American Express D Diners J JCB O Maestro International C Discover B Carte Bleue P China Union Pay[17]
cardexpiredate	+	N4	Expiry date YYMM
cardcvc2	o	N..4	Credit verification number (CVC)
cardissuenumber	-	N..2	Card issue number (only Maestro UK cards)
storecarddata	-	Default	no: Card data is not stored yes: Card data is stored, a pseudo card number is returned
language	-	Default	Language indicator (ISO 639)
Key			
N..x	Numeric value (x characters maximum)		
AN..x	Alphanumeric value (x characters maximum)		

[17] China Union Pay is under preparation and is expected to be available by 2016-10-01

Response "creditcardcheck"			
Parameter	**Required**	**Format**	**Comment**
status	+	Default	VALID = card number valid INVALID = card number invalid ERROR = request faulty
Parameter (VALID)			
pseudocardpan	o	N..19	Pseudo card number (is returned if storecarddata=yes)
truncatedcardpan	o	AN..19	Masked cardpan, i.e. 411111xxxxxx1111 (is returned if storecarddata=yes)
cardtype	o	Default	Cardtype selected by consumer
cardexpiredate	o	N..4	Card expiredate selected by consumer in YYMM
Parameter (INVALID)			
errorcode	+	N..6	Error number
errormessage	+	AN..1024	Error message
customermessage	-	AN..1024	Error message for the end customer (Language selection is based on the end customer's language, „language")
Parameter (ERROR)			
errorcode	+	N..6	Error number
errormessage	+	AN..1024	Error message
customermessage	-	AN..1024	Error message for the end customer (Language selection is based on the end customer's language, „language")

3.4.2 Account verification (bankaccountcheck)

The BankAccountCheck checks the plausibility of German account details according to the current check digit algorithms and carries out a POS blacklist inquiry if required.

Request "bankaccountcheck"			
Parameter	**Required**	**Format**	**Comment**
aid	+	N..6	Sub account ID
checktype	-	Default	0 = regular check (default)
			1 = check against POS blacklist (only DE)
language	-	Default	Language indicator (ISO 639)
Check of national bank account			
bankcountry	+	Default	Account type/ country (ISO-3166)
			Please find available checks in chapter 5.4
bankaccount	+	AN..26	Account number [18]
bankcode	o	AN..11	Sort code
bankbranchcode	o	N..5	Branch code (only for FR, ES, FI, IT)
bankcheckdigit	o	AN..2	Check digit (only for FR, BE)
Check of international bank account			
iban	+	AN..35	IBAN[19, 20]
bic	+	AN..11	BIC
Key			
N..x		Numeric value (x characters maximum)	
AN..x		Alphanumeric value (x characters maximum)	

Response "bankaccountcheck"			
Parameter	**Required**	**Format**	**Comment**

---

[18] For Germany bankcode, bankaccount will be converted into IBAN, BIC automatically

[19] IBAN / BIC will be validated. It's not checked whether IBAN and BBAN (Bankcode/Bankaccount) refer to the same account. if both (IBAN and BBAN) are supplied IBAN is preferred and splitted into its BBAN.

[20] For Germany IBAN, BIC will be converted into bankcode, bankaccount automatically

Response "bankaccountcheck"			
status	+	Default	VALID = account details valid
			INVALID / ERROR = account details invalid
			BLOCKED = account details found on blacklist (checktype=1 only)
			ERROR = request faulty
Parameter (VALID)			
bankcountry	o	Default	Account type/ country (ISO-3166)
			Please find available checks in chapter 5.4
bankcode	o	AN..11	Sort code in standardised country format (if standardisation is supported)

bankbranchcode	o	N..5	Branch code
bankcheckdigit	o	AN..2	Check digit
iban	o	AN..50	IBAN[21]
bic	o	AN..11	BIC
Parameter (INVALID)			
errorcode	+	N..6	Error number
errormessage	+	AN..1024	Error message
customermessage	-	AN..1024	Error message for the end customer (Language selection is based on the end customer's language, „language")
Parameter (ERROR)			
errorcode	+	N..6	Error number
errormessage	+	AN..1024	Error message
customermessage	-	AN..1024	Error message for the end customer (Language selection is based on the end customer's language, „language")

---

[21] **Parameters will not be provided actually to prevent declined requests by merchant systems that do not expect these key/values by now. Parameters have to be enabled in PMI, Configuration, Payment portals, General: "Additional response-data" for mode test and live.**

3.4.3 Address verification (addresscheck)

Verification and correction of address details.

The verification of the address is carried out to minimize the risk of non-payment and to correct the entered address information. Deviations in the address details are corrected automatically.

Request "addresscheck"			
Parameter	**Required**	**Format**	**Comment**
aid	+	N..6	Sub account ID
addresschecktype	+	Default	BA: Addresscheck Basic PE: Addresscheck Person
firstname	o	AN..50	First name (required for "Addresscheck Person")
lastname	o	AN..50	Surname (required for "Addresscheck Person")

customermessage	-	AN..1024	Error message for the end customer (Language selection is based on the end customer's language, „language")

3.4.4 Verification of creditworthiness (consumerscore)

Checking customer data for any existing adverse criteria.

The customer check is carried out to determine the risk of non-payment of demands against customers. With the help of consumer information (adverse criteria) a score value is determined which you can use to assess the creditworthiness of the customers, get a realistic picture of the risk of non-payment and offer the corresponding types of payment.

Request "consumerscore"			
Parameter	**Required**	**Format**	**Comment**
aid	+	N..6	Sub account ID
addresschecktype	+	Default	BA: Addresscheck Basic PE: Addresscheck Person NO: Do not carry out address check

customermessage	-	AN..1024	Error message for the end customer (Language selection is based on the end customer's language, „language")

4　Responses

4.1　Parameter for SessionStatus query

According to the configuration of your payment portal you will receive access status changes for accesses to your premium sector. You will only receive these status messages with payment portals of the "Access" version. You can use them to protect your premium sector or to receive information about a subscription. The data is submitted to the URL specified in the merchant area. The data transfer is based on simple HTTP-POST request (key/value pairs).

The SessionStatus is sent from the following IP addresses: 185.60.20.0/24 (i.e. 185.60.20.1 to 185.60.20.254). Please configure your firewall to allow incoming packets from these IP addresses.

HTTP request from PAYONE to the merchant's server			
Parameter	**Required**	**Format**	**Comment**
key	+	AN..32	Key can be selected freely (see options payment portal) as MD5 value (The key hash values is actually given as MD5. This actually still remains with MD5 and is subject to change in future to SHA2-384.)
accessid[x]	+	N..12	Access ID (PAYONE)
action[x]	+	Default	Event, which refers to one customer each. "add" , "remove", "abocancel", "renew "cancel_reversal", "lock", "unlock" (see below)
portalid[x]	+	N..7	Payment portal ID
productid[x]	+	N..7	ID for the offer
expiretime[x]	+	N..12	Unix timestamp at which access expires
userid[x]	+	N..12	Debtor ID (PAYONE)
customerid[x]	-	AN..20	Merchant's customer ID
accessname[x]	-	AN..32	Customer's user name
accesscode[x]	-	AN..32	Customer's password
ip[x]	-	AN..15	Customer IP
param[x]	-	AN..15	Individual parameter
Key	**x**	**x**	**x**
N..x	x	x	Numeric value (x characters maximum)
AN..x	x	x	Alphanumeric value (x characters maximum)
[x]	x	x	In this manner changes for several customers can be submitted simultaneously in one request. [x] = position number, e.g. [0],[1],...)

Important note: Please note that new parameters may be added at any time without previous notice. Therefore, you should use the parameter name for the evaluation and not the sequence, which may be subject to change at any time!

Expected reply to the request:

As a reply to the request, the string "**SSOK**" is expected. Each request is repeated in a 1-hour cycle until it is answered with "SSOK". This procedure ensures that all requests will be processed by your system. Simply issue the "SSOK" in a script via the "print" command. Make sure that this character string is the first that is printed from this script, e.g. `print ("SSOK");`

Important:

- Status messages from PAYONE to merchant's server are always ISO-8859-1 encoded.

- No other characters may be issued from this character string, e.g. no HTML code.

- Do not return an error without gathering information about this error.

- Make sure the request is always answered with an SSOK within 48 hours.

- If a specific request shall not be processed, issue an SSOK anyway to prevent the request from interfering with the processing of other requests.

- Without the return of an SSOK you will not receive any further status reports for that subscription.

- The request must be answered with "SSOK" within 10 seconds. This time-out cannot be extended. The answer does only confirm receipt of the SessionStatus, the evaluation can and should follow asynchronously to receiving the answer.

Sequence of events

After the start of the initial term an "add" request is deployed to your system. Different pieces of information about this customer are submitted (see above). After the access has expired, you will receive a "remove" request.

Events (action)

With each access status change you receive a request. Via the "action" variable you receive information about the status of the access.

add

An access portal has been opened.

remove

Access has expired and will not be renewed.

renew

Access was renewed/reduced (e.g. renewal of a subscription).

abocancel

The customer has cancelled the subscription for this access portal.

lock

Access has been blocked.

unlock

Access has been unblocked.

cancel_reversal

The termination of the subscription has been revoked.

4.2 Parameter for the TransactionStatus query

According to the configuration of your payment portal you will receive the data and the status for each payment process via the URL you have submitted. The data transfer is based on simple HTTP-POST request (key/value pairs).

The TransactionStatus is sent from the following IP addresses: 185.60.20.0/24 (i.e. 185.60.20.1 to 185.60.20.254). Please configure your firewall to allow incoming packets from these IP addresses.

HTTP request from PAYONE to the merchant's server			
Parameter	**Required**	**Format**	**Comment**
key	+	AN..32	Payment portal key as MD5 value (The key hash values is actually given as MD5. This actually still remains with MD5 and is subject to change in future to SHA2-384.)
txaction	+	Default	"appointed", "capture", "paid", "underpaid", "cancelation", "refund", "debit", "reminder", "vauthorization", "vsettlement", "transfer", "invoice", "failed" (See explanation below)
transaction_status	-	Default	"completed", "pending" new parameter in use from January 2015
notify_version	-	Default	7.3 without "notify_version" and without "transaction_status" 7.4 with "notify_version" and with "transaction_status" (completed/pending) 7.5 with txaction "failed" (actually supported for Barzahlen with expired refund; other payment types will follow)
mode	+	Default	test Test mode live Live mode
portalid	+	N..7	Payment portal ID
aid	+	N..6	Sub account ID
clearingtype	+	Default	elv Debit payment cc Credit card vor Prepayment rec Invoice cod Cash on delivery sb Online bank transfer wlt e-Wallet fnc Financing
txtime	+	N..11	Initiating payment process (Unix timestamp)
currency	+	Default	Currency (ISO 4217)
userid	+	N..12	Debtor ID (PAYONE)

HTTP request from PAYONE to the merchant's server			
Parameter	**Required**	**Format**	**Comment**
customerid	-	AN..20	Merchant's customer ID
param	-	AN..255	Individual parameter that was, where applicable, submitted while payment was initiated
Parameter (personal data)			
Invoice-Address			
firstname	o	AN..50	First name (optional if company is used)
lastname	+	AN..50	Surname
company	-	AN..50	Company
street	-	AN..50	Street number and name
zip	-	AN..10	Postcode
city	-	AN..50	City
country	+	Default	Country (ISO 3166)
Delivery-Address			
shipping_firstname	-	AN..50	First name (optional if company is used)
shipping_lastname	-	AN..50	Surname
shipping_company	-	AN..50	Company
shipping_street	-	AN..50	Street number and name
shipping_zip	-	AN..10	Postcode
shipping_city	-	AN..50	City
shipping_country	-	Default	Country (ISO 3166)
email	-	AN..50	Email address
Parameter for the status message of a payment process			
txid	+	N..12	Payment process ID (PAYONE)
reference	+	AN..20	Merchant reference number for the payment process
sequencenumber	+	N..2	Sequence number at the time of the event for this payment process (0..n)
price	+	N..7,2	Payment request (in largest currency unit! e.g. Euro)
receivable	-	N..7,2	Total payment request (in largest currency unit! e.g. Euro); not set for encashment reminder status information without paid amount
balance	-	N..7,2	Balance of transaction account (in largest currency unit! e.g. Euro) ; not set for encashment reminder status information without paid amount Negative amount: positive balance Positive amount: payment request
failedcause	-	Default	Reason for return debit note or incorrect collection (see chapter 5)
Additional parameter Contract for the status message of a payment process			
productid	+	N..7	ID for the offer

HTTP request from PAYONE to the merchant's server			
Parameter	**Required**	**Format**	**Comment**
accessid	+	N..12	Access ID
expiretime	-	N..12	Unix Timestamp an dem der Zugang abläuft
Additional parameter for payment type debit payment			
bankcountry	-	Default	Account type/ country
bankaccount	-	AN..26	Account number (masked)
bankcode	-	AN..11	Sort code
bankaccountholder	-	AN..35	Account holder
Additional parameter for payment type debit payment (only for authorization with appointed and only if "due_time" is not specified)			
iban	o	AN..35	International Bank Account Number (masked)
bic	o	AN..11	Bank Identifier Code
mandate_identification	o	AN..35	Used mandate_identification
creditor_identifier	o	AN..35	Merchant's creditor identifier
clearing_date	o	N8	clearing date (format YYYYMMDD)
clearing_amount	o	N..7,2	Payment request (in largest currency unit! e.g. Euro)
Additional parameter for payment type credit card			
cardpan	+	N..19	Card number
cardtype	+	Default	Card type V: Visa M: MasterCard A: Amex D: Diners J: JCB O: Maestro International U: Maestro UK C: Discover B: Carte Bleue
cardexpiredate	+	N4	Expiry date YYMM
cardholder	-	AN..35	Name of cardholder
Additional parameter for payment type BillSAFE / Klarna			
clearing_bankaccountholder	-	AN..35	Recipient bank account holder
clearing_bankcountry	-	Default	Recipient account type/ country (e.g. DE, AT, etc.)
clearing_bankaccount	-	AN..26	Recipient bank account
clearing_bankcode	-	AN..11	Recipient sort code
clearing_bankiban	-	AN..35	Recipient IBAN
clearing_bankbic	-	AN..11	Recipient BIC
clearing_bankcity	-	AN..50	Recipient city or bank
clearing_bankname	-	AN..50	Recipient bank name

HTTP request from PAYONE to the merchant's server			
Parameter	**Required**	**Format**	**Comment**
clearing_legalnote	-	AN..500	Note to claim assignment
clearing_duedate	-	N8	Due date of payment (format YYYYMMDD)
clearing_reference	-	AN..50	Reference
clearing_instructionnote	-	AN..200	Note to payment handling
Additional parameter Collect (txaction=reminder) for the status message of a payment process			
reminderlevel	+	Default	Customer's reminder status 1…4: Dunning level 1-4 5: Encashment A: Dunning procedure ended S: Dunning procedure begins M: Dunning proposal list I: Encashment proposal list 0: Dunning procedure completed
encashment_statuscode	-	AN..20	Internal status code of the encashment agency, if provided by the encashment agency.
encashment_statuslongtext	-	AN..255	Free text: if the encashment agency has reported a long text (detailed information) on the status
Parameter Invoicing (txaction=invoice)			
txid	+	N..12	Payment process ID (PAYONE)
reference	+	AN..20	Merchant reference number for the payment process
sequencenumber	+	N..2	Sequence number at the time of the event for this payment process (0..n)
invoiceid	+	AN..20	Merchant's invoice number
invoice_grossamount	+	N..7,2	Gross invoice amount
invoice_date	+	N8	Invoice date (format YYYYMMDD)
invoice_deliverydate	-	N8	Delivery date (format YYYYMMDD)
invoice_deliveryenddate	-	N8	Delivery period end date (format YYYYMMDD)
Parameter Billing (txaction=vauthorization/vsettlement)			
vaid	+	N..8	Billing account ID (module billing)
balance	+	N..7,2	Balance of billing account (in largest currency unit! e.g. Euro) Negative amount: positive balance Positive amount: payment request
vreference	+	AN..20	Merchant's transaction reference number (This is the reference for the corresponding payment process for a vsettlement)
vxid	+	N..12	Billing account entry ID
Parameter Billing (txaction=vsettlement)			
txid	o	N..12	Corresponding payment process ID
sequencenumber	o	N..2	Sequence number of settled payment process ID

HTTP request from PAYONE to the merchant's server			
Parameter	**Required**	**Format**	**Comment**
settled_vxid[n]	o	N..12	Array of settled vxid's starting with n=0. Array will not be sent if more than 500 vxid's are settled.
Key			
N..x			Numeric value (x characters maximum)
AN..x			Alphanumeric value (x characters maximum)

Important note: Please note that new parameters may be added at any time without previous notice. Therefore, you should use the parameter name for the evaluation and not the sequence, which may be subject to change at any time!

Expected reply to the request:

As a reply to the request, the string "**TSOK**" is expected. Each request is repeated in a 1 to 6 hour cycle until it is answered with "TSOK". This procedure ensures that all requests will be processed by your system. Simply issue the "TSOK" in a script via the "print" command. Make sure that this character string is the first that is printed from this script, e.g. `print ("TSOK");`

Important:

- Status messages from PAYONE to merchant's server are always ISO-8859-1 encoded.

- No other characters may be issued from this character string, e.g. no HTML code.

- Do not return an error without gathering information about this error.

- Make sure the request is always answered with a TSOK within 48 hours.

- If a specific request shall not be processed, issue a TSOK anyway to prevent the request from interfering with the processing of other requests.

- Without the return of an TSOK you will not receive any further status reports for that payment process.

- The request must be answered with "TSOK" within 10 seconds. This time-out cannot be extended. The answer does only confirm receipt of the TransactionStatus, the evaluation can and should follow asynchronously to receiving the answer.

4.2.1 List of events (txaction)

With each payment process status change you receive a request. The last event is submitted to you via the parameter "txaction". The status of the request is provided via the balance of the payment process (parameter "balance") and the amount of the request (parameter "receivable").

appointed

Via "appointed" you are informed about the successful initiation of the payment process. This request is affected immediately after the first successful booking.

Important note:

- The new parameter "transaction_status" indicates whether the event "appointed" is pending or completed.
  -> see list of status (transaction_status)

capture

Via "capture" you are informed about the booking of a request or the collection of your reserved amount. The amount of the request (receivable) is increased in this case. If no settlement of balances occurs, the balance changes as well.

paid

Via "paid" you are informed that the booking has been processed by the credit institution or that the customer has paid the invoice in full. The balance for the request in this case is smaller than or equal to zero.

underpaid

Via "underpaid" you are informed about an underpayment. The balance for the request in this case is greater than zero.

cancelation

Via "cancelation" you are informed that a payment process has resulted in a return debit note. In the case of electronic direct debit processes (ELV) insufficient funds in the account may also be the cause. The balance for the request in this case is greater than zero.

refund

Via "refund" you are informed if an amount has been refunded. The amount of the request (receivable) is decreased in this case.

debit

Via "debit" you are informed about the booking of a request/credit for a request. The amount of the request (receivable) changes in this case. If no settlement of balances occurs, the balance changes as well.

transfer

Via "transfer" you are informed if an amount has been transferred. The amount of the open balance (balance) changes in this case.

reminder (Attention: This request must be activated by PAYONE.)

Via "reminder" you are informed about the current status of the dunning procedure.

vauthorization (Attention: This request must be activated by PAYONE.)

Via "vauthorization" you are informed about a booking affected into a billing account (module billing).

vsettlement (Attention: This request must be activated by PAYONE.)

Via "vsettlement" you are informed about a settlement effected on a particular billing account (module billing).

invoice (Attention: This request must be activated by PAYONE.)

Via "invoice" you are informed that an invoice or a credit voucher has been created.

failed (for future use – not implemented yet.)

Via "failed" you are informed that the booking has finally failed. No further actions are possible.

4.2.2 List of status (transaction_status)

Via "pending" you are informed that the payment transaction is (still) pending at the external payment processor. The following transaction status may be "pending" (again), "completed" (external payment processor completed the actual transaction successfully).

With each payment process status change you receive a request. The last event is submitted to you via the parameter "txaction".

The parameter "transaction_status" is actually introduced with event-txaction "appointed" only. Other event-txaction with parameter "transaction_status" may follow (e.g. "paid", "debit", ...).

Please note:

- **The parameter "transaction_status" is optional and not available for all payment transactions ("txaction") and all payment types (as not all payments and processors do support "pending" / "completed").**
- **It may happen that you will receive two times the same txaction (e.g. "appointed"). First with "pending" and then with "completed".**

pending

The event indicated by "txaction" is pending and may change later. i.e. an event "appointed/pending" (txaction/transaction_status) indicates that the payment is pending and in process at the 2nd payment processor.

Another event may follow to inform change of status by txaction e.g. "appointed/completed", "failed/completed".

Also another "appointed/pending" may follow to indicate that transaction is still pending.

completed

Indicates that the event itself has reached final status.

However a new "txaction" (e.g. "paid", "cancelation", ...) may follow to inform of change of status.

The new "txaction" can then be "paid/pending", "paid/completed", ... or "failed/completed".

4.2.3 Explanation of price, balance, receivable

Field	Description
price	Value of the initial claim
balance	The outstanding balance of this transaction: • negative: Customer has a claim against merchant, e.g. merchant received money without effort • positive: Merchant has a claim against the customer
receivable	Account balance for the transaction. • With a "preauthorization" the value "receivable" is not set as the merchant did not provide the service yet (e.g. delivering goods). • With type of payment "cash In advance" the value "receivable" is not set as the merchant will only provide its service when money has arrived.

4.2.4 Sample: authorization, CC

Merchant's request	Seq-No	Time	HTTP request from PAYONE to the merchant's server	Seq-No	price	balance	receiv-able	Comment
			TX-Action/transaction_state[22]					
Request authorization CC amount=15061	0	T=0	appointed /completed	0	150.61	150.61	150.61	
	0	+4 min	paid	0	150.61	0	150.61	

---

[22] Internal reference: 148021809

4.2.5 Sample: preauthorization/capture, CC

Merchant's request			HTTP request from PAYONE to the merchant's server					Comment
	Seq-No	Time	TX-Action/tran saction_stat e [23]	Seq-No	price	balance	receiv-able	
Request preauthorization CC amount=2950	0	T=0	appointed /complet ed	0	29.50	0.00	0.00	
Request capture	1	+2 hours	paid	1	29.50	0	29.50	

---

[23] Internal reference:

4.2.6 Sample: authorization, ELV with cancelation

Merchant has configured:

- Due time ELV = 7 days
- Fee 1. reminder = 0,00 Euro after 7 days
- Fee 2. reminder = 1,00 Euro after 7 days
- Fee 3. reminder = 2,40 Euro after 7 days
- Encashment transfer = 5,00 Euro after 7 days
- TxStatus without reminder-information

Merchant's request	Seq-No	Time	TX-Action/transaction_state [24]	Seq-No	price	balance	receiv-able	Comment
		HTTP request from PAYONE to the merchant's server						
Request authorization ELV amount=4612	0	T=0	appointed /completed	0	46.12	46.12	46.12	Merchant initiates payment via SEPA direct debit
		+15 min	paid	0	46.12	0	46.12	PAYONE platform has processed direct debit
		+7 days	cancelation	0	46.12	54.72	54.72	PAYONE platform has detected a return debit note initiated by end customer and added bank charges of 8,60 EUR and 0 Euro dunning fee
		+14 days (7+7)	debit	1	46.12	55.72	55.72	PAYONE platform processed dunning note and added 1,00 Euro dunning fee
		+21 days	debit	2	46.12	57.72	57.72	PAYONE platform processed dunning note and added 2,00 Euro dunning fee
		+28 days	debit	3	46.12	62.72	62.72	PAYONE platform processed dunning note and added 5,00 Euro dunning fee

---

[24] Internal reference: 146039593

4.2.7 Sample: preauthorization/capture, REC with credit note

Merchant has configured:

- Due time Invoice = 14 days
- Fee 1. reminder = 0,00 Euro after 3 days
- Fee 2. reminder = 2,00 Euro after 10 days
- Fee 3. reminder = 4,00 Euro after 10 days
- TxStatus without reminder-information

Merchant's request			HTTP request from PAYONE to the merchant's server					Comment
	Seq-No	Time	TX-Action/transaction_state [25]	Seq-No	price	balance	receiv-able	
Request preauthorization REC amount=11500	0	T=0	appointed /completed	0	115.00	0.00	0.00	Merchant initiates payment via payment type invoice
Request capture	1	+1 day	capture	1	115.00	115	115	Merchant has delivered ordered items
		+27 days (14+3+10)	debit	2	115.00	117	117	PAYONE platform generates reminder document and added 2 Euro dunning fee
		+10 days	debit	3	115.00	121	121	PAYONE platform generates reminder document and added 4 Euro dunning fee
PMI: credit note by 15,00 Euro	4	+13 days	debit	4	115.00	106	106	PAYONE platform processed credit note initiated via PMI

---

[25] Internal reference: 136229273

4.2.8 Sample: preauthorization, WLT (with "pending")

Merchant's request			HTTP request from PAYONE to the merchant's server					Comment
	Seq-No	Time	TX-Action/transaction_state[26]	Seq-No	price	balance	receiv-able	
Request authorization WLT amount=1561	0	T=0	appointed /pending	0	15.61	0.00	0.00	
	0	+6 seconds	appointed /completed	0	15.61	0	0.00	
	0	+6 min	paid	0	15.61	-15.61	0	

---

5 Codes

5.1 Reasons for return debit notes

Parametername: failedcause

Code	Signification
soc	Insufficient funds
cka	Account expired
uan	Account no. / name not identical, incorrect or savings account
ndd	No direct debit
rcl	Recall[27]
obj	Objection[28]
ret	Return[29]
nelv	Debit cannot be collected
cb	Credit card chargeback
ncc	Credit card cannot be collected

---

[27] Recall: The recipient of the payment recalls the direct debit order.

[28] Objection: The payer objects to the direct debit.

[29] Return: The executing bank returns the order (due to insufficient funds, account closure, decease of the account holder, …).

5.2 Bank groups

Parametername: bankgrouptype

Code	Signification
Banks for EPS (Austria)	
ARZ_OVB	Commercial credit cooperatives (Volksbank)
ARZ_BAF	Bank for doctors and independent professions
ARZ_NLH	Hypo state bank Lower Austria
ARZ_VLH	Hypo state bank Voralberg
ARZ_BCS	Bankhaus Carl Spängler & Co. AG
ARZ_HTB	Hypo bank Tyrol
ARZ_HAA	Hypo Alpe Adria
ARZ_IKB	Investkredit bank
ARZ_OAB	Österreichische Apothekerbank
ARZ_IMB	Immobank
ARZ_GRB	Gärtnerbank
ARZ_HIB	HYPO Investment bank
BA_AUS	Bank Austria
BAWAG_BWG	BAWAG
BAWAG_PSK	PSK Bank
BAWAG_ESY	easybank
BAWAG_SPD	Sparda Bank
SPARDAT_EBS	Erste Bank
SPARDAT_BBL	Bank Burgenland
RAC_RAC	Raiffeisen bank
HRAC_OOS	Hypo bank Upper Austria
HRAC_SLB	Hypo bank Salzburg
HRAC_STM	Hypo bank Styria
EPS_SCHEL	Bankhaus Schelhammer
EPS_OBAG	Oberbank AG
EPS_SCHOELLER	Schoellerbank AG
EPS_SPDLI	Sparda-Bank Linz
EPS_SPDVI	Sparda-Bank Villach
EPS_VRBB	VR-Bank Brunau
Banks for iDEAL (The Netherlands)	
ABN_AMRO_BANK	ABN Amro
RABOBANK	Rabobank
FRIESLAND_BANK	Friesland Bank
ASN_BANK	ASN Bank
SNS_BANK	SNS Bank
TRIODOS_BANK	Triodos
SNS_REGIO_BANK	SNS Regio Bank

ING_BANK	ING
KNAB_BANK	Knab Bank
VAN_LANSCHOT_BANKIERS	van Lanschot Bank

5.3 Parameters for AVS returns

Parametername: protect_result_avs

Under "street number" any numeric parts of the street name and street number, as well as the postal code of the invoice address are validated, e.g. "Münchhausenstraße 22, 3rd Floor", "D-12345" -> "223" and "12345" are validated.

Code	Signification
A	Street number is OK, postal code is not OK
F	Street number and postal code are OK
N	Neither street number nor postal code are OK
U	Request is not supported
Z	Street number is not OK, but postal code is OK

5.4 BankAccountCheck (Available countries)

Continious updates of check digit algorithms of Deutsche Bundesbank incl. check of Bankcode and of Österreichischen Nationalbank:

	bank-country	bank-account	bank-code	bank-branch-code	bank-check-digit
Germany (DE)	x	x	x	-	-
Austria (AT)	x	x	x	-	-
Key: x =mandatory, o = optional, - = not used					

In these European countries the bank account will be syntax-checked and also validated with a check digit algorithm:

	bank-country	bank-account	bank-code	bank-branch-code	bank-check-digit
Niederlande (NL)	x	x	-	-	-
Schweden (SE)	x	x	o	-	-
Belgien (BE)	x	x	o	-	o
Frankreich (FR)	x	x	x	x	x
Norwegen (NO)	x	x	o	-	-
Polen (PL)	x	x	o	-	o
Key: x =mandatory, o = optional, - = not used					

In these countries the bank account will be syntax-checked:

	bank-country	bank-account	bank-code	bank-branch-code	bank-check-digit
Denmark (DK)	x	x	o	-	-
Swiss (CH)	x	x	x	-	-
Finland (FI)	x	x	o	-	-
Italy (IT)	x	x	o	o	o
Spain (ES)	x	x	o	o	o
United Kingdom (GB)	x	x	x	-	-
Key: x =mandatory, o = optional, - = not used					

5.5 Parameters for Consumerscore returns

Parametername: secscore

I. "Weak" negative attributes (Data from collection - pre court):		Weiche Negativmerkmale
IA	Initiation of collection process	Inkasso-Mahnverfahren eingeleitet
AM	Continuation of extrajudicial collection procedures after partial payments or instalments.	Fortlauf des außergerichtlichen Inkasso-Mahnverfahrens nach Teil- bzw. bei Ratenzahlung
IE	Dismissal of extrajudicial collection proceedings du to futility	Einstellung des außergerichtlichen Inkasso-Mahnverfahrens wegen Aussichtslosigkeit

II. "Middle" negative attributes (Data from collection - court):		Mittlere Negativmerkmale
MB	Payment ordered by the court	Antrag auf Mahnbescheid
VB	Enforcement order from the court	Antrag auf Vollstreckungsbescheid
TR	Payment installment plan resulting from court decision	Ratenzahler nach Forderungs-Titulierung
ZWA	Levy of execution to liquidate personal assets (non real-estate)	Zwangsvollstreckung in das bewegliche Vermögen
ZWI	Levy of execution to liquidate personal assets (real-estate)	Zwangsvollstreckung in das unbewegliche Vermögen
FRP	Futile collections attempt	fruchtlose Pfändung
LP	Garnishment of wages	Lohn- oder sonstige Forderungspfändung aufgrund eines gerichtlichen Pfändungs- und Überweisungsbeschlusses
UF	Non collectable legally binding payment claim	uneinbringliche, titulierte Forderung
UBV	Relocation leaving no forwarding address	unbekannt verzogen (unter Hinterlassung von Verbindlichkeiten aus Geld- oder Warenkrediten)
SU		Suchauftrag zu - unter Hinterlassung von Verbindlichkeiten - unbekannt verzogenen Personen (Adresse über Einwohneramt nicht ermittelbar)

III. "hard" negative attributes (Data from public lists of debtors / / Bundesanzeiger):		Harte Negativmerkmale
HB	Warrant to provide Affidavit	Haftbefehl zur Erzwingung der eidesstattlichen Versicherung
HV	Execution of warrant to provide Affidavit	Vollstreckung des Haftbefehls zur Erzwingung der EV
EV	Affidavit or oath of disclosure	eidesstattliche Versicherung ("Offenbarungseid")
EEV	Amendment to Affidavit	Ergänzung der eidesstattlichen Versicherung
WEV	Repeated affidavit or oath of disclosure	wiederholte eidesstattliche Versicherung (§ 903 ZPO)
SVV		Verweigerung der Vermögensauskunft gem. §882c Abs. 1 Nr. 1 ZPO

SAV		erkennbare Aussichtslosigkeit der Vollstreckung gem. §882c Abs. 1 Nr. 2 ZPO
SNZ		Nichtzahler gem. §882c Abs. 1 Nr. 3 ZPO
IVE	Extrajudicial settlement attempt in the course of insolvency proceedings	außergerichtlicher Einigungsversuch im Rahmen des Insolvenzverfahrens
ISP	Initiation of debt settlement plan / initiations of insolvency proceedings	Schuldenbereinigungsplan-Verfahren eingeleitet / Antrag auf Eröffnung des Insolvenzverfahrens
IVS	Court ordered preliminary safeguard provisions in the course of insolvency	Anordnung von vorläufigen Sicherungsmaßnahmen im Insolvenzverfahren
IVA	Court ordered revocation of preliminary safeguard provisions in the course of insolvency	Aufhebung von vorläufigen Sicherungsmaßnahmen im Insolvenzverfahren
IBE	Institution of insolvency proceedings / court order	Eröffnung des Insolvenzverfahrens / Beschluss
IBA	Dismissal of insolvency proceedings du to insufficient assets	Abweisung bzw. Einstellung des Insolvenzverfahrens mangels Masse (§ 26 Abs. 2 InsO)
IWP	Reversal of insolvency proceedings / start of period of good conduct	Aufhebung des Insolvenzverfahrens
IRB	Discharge grant of outstanding debts	Erteilung der Restschuldbefreiung
IRV	Discharge denial of outstanding debts	Versagung der Restschuldbefreiung
KON	Dismissal of bankruptcy petitions du to insufficient assets (Prior to 1999)	Abweisung des Antrags auf Eröffnung des Konkurses mangels Masse (§ 107 KO)
KER	Institution of bankruptcy proceedings (Prior to 1999)	Eröffnung des Konkursverfahrens (§ 108 KO)
KEM	Suspension of bankruptcy proceedings due to insufficient assets (Prior to 1999)	Einstellung des Konkursverfahrens mangels Masse (§§ 202, 204 KO)
KAS	Revocation of bankruptcy proceedings (Prior to 1999)	Aufhebung des Konkursverfahrens (nach Schlusstermin) (§ 163 KO)
VGE	Institution of reorganizations proceedings	Eröffnung des Vergleichsverfahrens (§ 11 ff VerglO)
VGA	Institution of reorganizations proceedings	Abweisung des Antrages auf Eröffnung des Vergleichsverfahrens
VEM	Suspension of reorganizations proceedings	Einstellung des Vergleichsverfahrens nach Rücknahme des Vergleichsvorschlages (§ 99 ff VerglO)
VAS	Revocation of reorganizations proceedings	VAS Aufhebung des Vergleichsverfahrens (§ 90 ff VerglO)
GVA	Dismissal of petition to initiate comprehensive execution for insufficient assets	GVA Abweisung des Antrages auf Eröffnung der Gesamtvollstreckung mangels Masse (§ 4 Abs. 2 GesO)
GVE	Commercial Insolvency Arrangement	Eröffnung bzw. Anordnung der Gesamtvollstreckung (§ 5 GesO)
GEM	Commercial Insolvency	Einstellung des Gesamtvollstreckungsverfahrens
GAS	Aborted Commercial Insolvency	Aufhebung des Gesamtvollstreckungsverfahrens

Other	Sonstige Negativmerkmale

AE		Adressermittlung (Person unter der Adresse nicht zustellbar)
+++	Deceased	verstorben
HI		Hinweise zur Person oder Firma
HA		Risikohinweise zur Adresse (JVA, Obdachlosenunterkunft, o. ä.); TKZ 5

5.6 Error messages

No.	Signification	Activity
1	Card issuer temporarily not available	Please try again later.
2	Authorization declined	Decline purchase
4	Card not approved	Decline purchase
5	Authorization declined	Decline purchase
7	Required CVC code not specified or not valid	Specify/change CVC
12	Transaction invalid	Decline purchase
13	Limit exceeded	Decline purchase
14	Invalid card	Decline purchase
21	Activity not processed	Time for Capture after PreAuthorization has been exceeded (among other things)
30	Format Error in request message (e.g. CVC missing).	
31	Invalid card type	Change card type
33	Expiry date invalid, incorrect or in the past	Correct expiry date
34	Manipulation suspected	Decline purchase
43	Card stolen	Decline purchase
56	Card unknown	Decline purchase
62	Card cancelled	Decline purchase
80	Amount no longer available	Reservation period has elapsed. Please repeat preauthorization
91	Card issuer temporarily not available	Temporary problem
101	The authorisation has expired.	Restart entire process.
102	Authorisation denied.	
103	Transaction could not be completed successfully.	Customer is to select an alternative method of payment.
104	Customer could not pay.	Transaction rejected.
105	The customer has to be redirected to Wallet Provider in order to select a new payment method.	Redirect customer to Wallet Provider
106	The order has expired.	Close order
107	Risk assessment has denied this transaction.	
108	The transaction has already been completed.	
109	Transaction (credit) denied	The refund was rejected.

6   Glossar

Name	Description
BBAN	Basic Bank Account Number Describes the bank account specified by "classic" values: countrycode bankaccount bankcode (where applicable) bankbranchcode (where applicable) bankcheckdigit (where applicable)
BIN	Bank Identification Number Describes the issuing bank of a credit card and is represented by the first six digits of a credit card number (PAN).
CVV	Card Verification Code (aka CVC, "cardcvc2") The card verification code is a 3 or 4 digit code and printed on the rear side of the credit card. It must not be stored at any time.
IBAN	International Bank Account Number IBAN and BIC specify an international bank account. BIC is planned to be optional within Germany from 2014-02-01 and optional within international bank transfer (in Europe) from 2016-02-01.
MOTO	Mail Or Telephone Order Describes the order process where an operator processes a payment with details for a customer. The customer provides the payment details (credit card details, bank account details) via email or phone.
PAN	Primary account number Is the complete credit card number (from 13 to 19 digits) and must not be processed or stored without PCI DSS certification (neither in database nor in log files). PAN may only be recorded either encrypted (only with PCI DSS certification) or masked/truncated (max: 6x4).
Payment Process ID	Unique payment process Id assigned to each payment process by PAYONE Platform.
